

# Long-Term Care STATeam

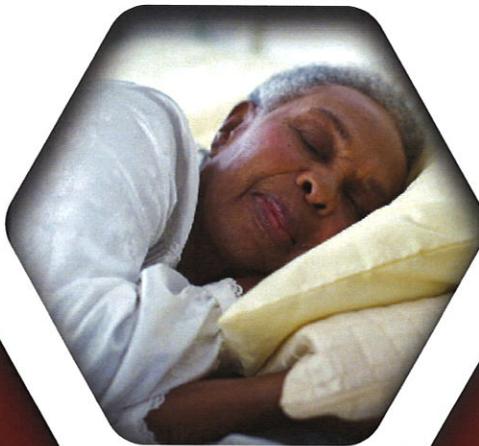

## Is Your Long-Term Care Facility Having a COVID-19 Outbreak?

*Book a free consultation to discuss your rapid response plan.*

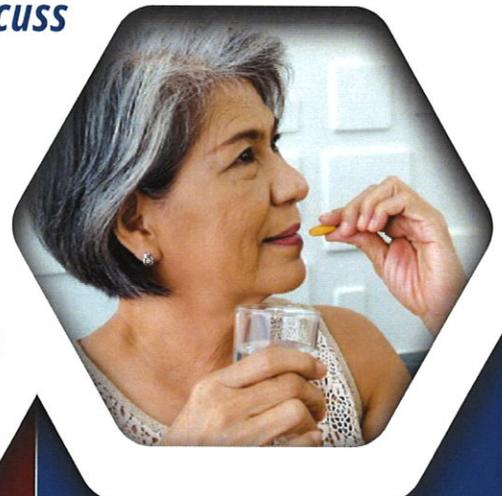

### Phase 1: Early Detection

Screen residents for the rapid identification of COVID-19 or other respiratory viruses. Per IDPH protocol, testing begins within 24-48 hours of a suspected outbreak and continues at intervals of 3-7 days until no new cases are detected for a consecutive 14-day period.

### Phase 2: Isolation & Containment

As cases are identified, residents are swiftly moved into isolation, and contact tracing is initiated. Cohort isolation for positive residents, combined with widespread screening, has proven effective in curbing the spread of the pathogen.

### Phase 3: Treatment & Recovery

Treatments, like Paxlovid, help improve prognosis and reduce the period of infectiousness. After recovery, schedule vaccination clinics to protect against future outbreaks.

*Programming for the LTC STATeam is produced by Prism Health Lab and made accessible to long-term care facilities at no cost, thanks to a grant from the Illinois Department of Public Health (IDPH). If you're experiencing an outbreak, contact us to book an initial consultation.*
